1. $5x + 4y = 7, 4x + 4y = 6; \$1.00; \$0.50$; Elimination is the easiest since the equations can be written in the form $Ax + By = C$ and the values of B are the same.
2. $82 - 5x = y, 37 - 2x = y; \$15.00; \$7.00$; Use substitution since the equations are in $y = mx + b$ form.
